

# VEHICLE TURNTABLES

In certain situations it is impossible to provide sufficient space within the curtilage of a site to provide on-site turning facilities, enabling all vehicles to enter and exit the site in a forward gear. The solution to this problem may be the provision of a vehicle turntable. Turntables may be manually or electronically operated and can be designed to accommodate more than one vehicle.

A minimum radius of 3.8m is required for use by a single vehicle. A 6.0m minimum radius may be used by two vehicles. Vehicles with a longer wheel base will require larger diameters accordingly. In every instance, a minimum clear overhang area around the turntable of at least 0.7m must be provided.
